

Classic TSF Experiments: Method Overview

1 Objective

Classic TSF will evaluate TimeTensors- and RevIN-like supervised forecasting experiments on Electricity, Traffic, Solar-Energy, Weather, Exchange Rate, and the four ETT datasets. PEMS is excluded. Every dataset is stored once in TIME's multivariate saved-Arrow representation and consumed through the common TIME loader.

2 Comparison contract

All methods will share chronological training, validation, and held-out test regions, training-window sampling, lookback lengths, forecast horizons, objectives, and run seeds. These choices remain intentionally unspecified and will be fixed before model implementation. Ports preserve the corresponding source experiment behavior unless an explicit scientific change is recorded.

3 Evidence boundary

No result is claimed until the shared protocol, model ports, and baselines are implemented and the project-owned artifacts are completed and inspected.
